## Webinar Information

### Description

After a brief review of the advantages of a code-based workflow for ecological survey data, we introduce participants to some useful tools available via the R programming language for moving data along the data life cycle. We suggest some accessible tools in R for each step of the life cycle, and conclude with a walk through of how the functionality available in R can increase the reliability, efficiency, and transparency of scientific data management.

## Presenters

- McCrea Cobb (Refuge Inventory and Monitoring Program, Alaska) and Adam Smith (Refuge Inventory and Monitoring Program, Legacy FWS Region )

## When

June 24, 2020 (3:00-4:30 EST)

## Location

Webinar link

## Additional resources

GitHub repository

## Outline

### Introduction (*McCrea, 10 min*)

- Data life cycle review
- Manual versus code-based workflow
  - The manual data workflow
    - \* Example
    - \* Limitations
  - The code-based data workflow
    - \* Advantages
      - Documented
      - Reproducible
      - Replicable
      - More efficient
      - Less error-prone

### Planning (*McCrea, 10 min*)

- Make an R project self contained and portable
  - File directory structure
  - Relative paths
- Dependency management
  - packrat
  - containers (docker)
- Standardize file naming convention
- Organizing R files (Numeric preface in the names of ordered scripts)
- Recommended RStudio settings

- E.g., Uncheck “restore .RData into workspace at startup”
- Version control
  - Storing versions
  - Collaboration

## Documenting (*Adam, 10 min*)

- rOxygen
- R documentation file
- Code commenting

## Acquiring (*Adam, 10 min*)

- local and remote
- querying data
  - AGOL
  - iNaturalist
  - PRIMR web services
  - SQL query: IRIS warehouse

## Processing (*Adam, 10 min*)

- Getting data into R
- QC
- Tidying data
- Visualizing
- EDA

## Analyzing (*Adam, 5 min*)

## Sharing (*McCrea, 10 min*)

- Reporting
  - RMarkdown
    - \* Bat reporting for mobile acoustics
  - Dashboards
  - COVID 19 example
  - Shiny apps
    - \* collarviewer
    - \* power analysis for butterfly surveys

## Archiving (*McCrea, 5 min*)

- Saving results to ServCat or some other data repository

## **An example R project / Live demo (*10 min*)**

## **Questions (*10 min*)**

## **Resources (Links)**

### **Introduction to R**

- An Introduction to R book
- R for Excel Users

### **Resources for Teaching R**

- DataCamp's tidyverse course
- learnr package
- RStudio teaching resources
- Data Wrangling, Exploration and Analysis with R "STAT 545"

### **R Resources**

- Why learn R
- What they forgot to teach you about R
- R cheatsheets
- Project-oriented workflow

### **Style Guides** - Tidyverse style guide - DataNovia R style guide

### **R Packages**

- Packaging your reproducible analysis
- R packages
- Packaging data analytical work reproducibly using R (and friends)

### **Project management**

- Stop working directory insanity!
- A minimal project tree in R
- Organizing the project directory
- Designing projects
- Project management with RStudio
- File structure for data management
- Organizing files for data analysis
- A meaningful file structure for R projects
- An introduction to Docker for R users

### **Project Directory Templates**

- MakeProject package
- rrttools package
- prodigenr package

## General Coding Best Practices

- What's in a name? The concepts and language of replication and reproducibility
- Best practices for scientific computing
- Good enough practices in scientific computing
- Ten simple rules for documenting scientific software
- Art of README - see examples and checklist
- Introduction to **roxygen2** vignette

## Version Control

- Happy Git with R

## Other

- How to share your data with a statistician
- Tools for reproducible research
- Reproducibility vs. replicability: a brief history of a confused terminology
